KONDRASOV, V. I.

Kondrakov, V. I. The behavior of functions from  $L_p$  on manifolds of different dimensions. Doklady Akad. Nauk SSSR (N.S.) 72, 1009-1012 (1950). (Russian)

This is a continuation of the author's investigation given in two earlier papers [C. R. (Doklady) Acad. Sci. URSS 48, 535-538 (1945); 51, 415-418 (1946); these Rev. 8, 32, 77] concerned with the space  $L_p$  of functions of  $n$  variables which together with their partial derivatives of order at most  $\nu$  have an  $L_p$ -norm. The functions are defined in a domain in a Euclidean space with a boundary  $\sum_n S_{n-k}$ , where each  $S_{n-k}$  is an  $(n-k)$ -dimensional manifold. If the manifold  $S_{n-k}$  satisfies certain conditions of smoothness, the author asserts that a certain type of strong convergence on  $S_{n-k}$  of a sequence of functions and their partial derivatives up to a certain order implies the convergence almost everywhere (with respect to measure on  $S_{n-k}$ ) of these functions and their partial derivatives. He also gives some results to the effect that the unit sphere in  $L_p$  is compact in certain other spaces.

A. C. Offord (London).

Kondrašov, V. I. On the theory of nonlinear and linear problems on characteristic values. Doklady Akad. Nauk SSSR (N.S.) 90, 129-132 (1953). (Russian)

Let  $W$  be the class of real functions  $u(x)$  ( $x = x_1, \dots, x_n$ ), defined in a domain  $D$  bounded by manifolds  $S_{n-s}$  of dimensions  $n-s=1, \dots, n-1$ , which possess partial derivatives  $y_1, \dots, y_s$  of order  $m$  whose  $p$ th powers are integrable in  $D$ . Let  $F(u)$  be a polynomial of degree  $p$  in the  $|y|$  whose coefficients are functions of  $x$  and let  $G(u)$  be a similar expression in terms of derivatives of orders  $\leq m-\lambda$ , the degree being  $q$ , subject to  $1 \leq \lambda \leq m$ ;  $1 < q < np(n-p\lambda)^{-1}$  and to the restriction of admissibility, i.e., integrability of  $F(u)$  and  $G(u)$  in  $D$  for each  $u \in W$ .

The author considers the problem of minimum of  $\int_D F(u) dx$  for functions  $u \in W$  subject to  $\int_D G(u) dx = 1$  and to the partial derivatives of orders  $< m - (s/p)$  vanishing in the mean on  $S_{n-s}$ , and announces a number of propositions, which generalize the quadratic case  $p=q=2$  and which connect the problem to eigen-values and eigen-functions. The absence of proofs and the condensed form of the definitions, together with a probable misprint in equation (1), detract somewhat from the clarity of the text.

L. C. Young (Madison, Wis.).

TITLE:

Theory of boundary value problems in regions with degenerate contours for partial variational and differential equations

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 143, no. 6, 1962, 1268-1271

TEXT: New results on boundary value problems of variational and differential equations in regions  $D$  are given. The functions that produce the functional spaces  $W_{p_1 \dots p_k}^{m_1 \dots m_k}$  introduced by the author (Doktorskaya dissertatsiya, Matem. inst. im. V. A. Steklova AN SSSR, 1948) are defined in  $D$ , and have generalized derivatives up to and including the  $m_k$ -th order.  $m_1, m_2, \dots, m_k$  are the orders of the derived functions of these spaces which, in the region  $D$ , are summable with the powers  $p_1, p_2, \dots, p_k$ . In this case,  $W_{p_1 \dots p_k}^{m_1 \dots m_k} = W_{p_1}^{m_1} \cdot W_{p_2}^{m_2} \dots W_{p_k}^{m_k}$ . The first boundary value problem

ABSTRACT: A correspondence is set up between a functional space and a class of partial differential equations defined by its metric. The properties of the functions of this space lead to natural formulations of boundary value problems for these equations and their solution. The variational method is used to solve problems in the space  $W^{m_1 \dots m_k}_{p_1 \dots p_k}$ , and the author notes thatproblems in the space  $W^{m_1 \dots m_k}_{p_1 \dots p_k, b_1 \dots b_n}$  are similar. AUTHORS: Gal'pern, S.A.; Kondrashov, V.Ye.

TITLE: Cauchy problem for a differential operator decomposing into wave factors

SOURCE: AN SSSR. Doklady\*, v.154, no.4, 1964, 757-759

TOPIC TAGS: cauchy problem, wave equation, differential operator, differential equation, partial derivative, mathematical physics, plane wave

ABSTRACT: This work is devoted to the Cauchy problem for the equation

$$\mathcal{L}u = \prod_{k=1}^n \left( \frac{\partial^2}{\partial t^2} - \frac{1}{a_k^2} \Delta \right)^{r_k} u(x, t) = 0, \quad (1)$$

where

$$a_1 > a_2 > \dots > a_n > 0; \Delta = \sum_{j=1}^n \frac{\partial^2}{\partial x_j^2}; x = (x_1, \dots, x_n).$$

Let  $2m$  be the order of equation (1);  $m = r_1 + r_2 + \dots + r_n$ . The in-

Card 1/3

ACCESSION NR: AP4012958

initial conditions are such that

$$\left. \frac{\partial^s u}{\partial r^s} \right|_{r=r_1} = f_s(x), \quad s = 0, 1, \dots, 2m-1. \quad (2)$$

The solution to this equation can be obtained if the solution to the problem with such initial conditions is such that

$$\left. \frac{\partial^s u}{\partial r^s} \right|_{r=r_0} = 0, \quad s = 0, 1, \dots, 2m-2, \quad (3)$$

$$\left. \frac{\partial^{2m-1} u}{\partial r^{2m-1}} \right|_{r=r_0} = f(x). \quad s = 2m-1.$$

are known. In the case where  $r_1=r_2=\dots=r_0=1$ , the solution can be obtained by means of the classical Herglotz-Petrovskiy formulas for a homogeneous and strictly hyperbolic equation. It is of some interest to obtain formulas for solving the problem through the spherical means of the initial functions, i.e. formulas which are analogous to the generally known formulas, yielding a solution to the Cauchy problem for a wave equation. The authors obtained such formulas for the solution of (1) with unrestricted  $r_k$ . These formulas help to determine precisely the degree of smoothness of the initial functions. They are also useful in solving the problem of the nature of the

Card 2/3

ACCESSION NR: AP4012958

relationship of a solution to the equation in the apex of the characteristic cone to the values of the initial functions in each of those domains on which the surface of the characteristic cone lays out the plane of the initial data, i.e. when some of these domains will be gaps or weak gaps. The Cauchy problem with initial conditions of the general form (2) can be reduced to a Cauchy problem (3) and solution of the problem (2) is a linear combination of solutions of the type (3) and their derivatives with respect to t. Orig. art. has: 5 equations.

TITLE: Fundamental solutions to problems correct in a half-space for certain regular equations with multiple curves

SOURCE: Sibirski<sup>16</sup> matematicheskiy zhurnal, v. 6, no. 2, 1965, 323-341

TOPIC TAGS: differential equation, wave equation, La Place equation, Schroedinger equation

ABSTRACT: Let

$$Lu(x, t) = \left[ \frac{\partial^m}{\partial t^m} - \sum_{k=0}^{m-1} p_k \left( i \frac{\partial}{\partial x_1}, \dots, i \frac{\partial}{\partial x_n} \right) \frac{\partial^k}{\partial t^k} \right] u(x, t) = 0 \quad (1)$$

be a differential equation with constant coefficients. Equation (1) is said to be regular (to be more precise, 0-regular) if for all  $\sigma$  values from the real space  $R_n$  the algebraic equation

$$\lambda^m - \sum_{k=0}^{m-1} p_k(\sigma_1, \dots, \sigma_n) \lambda^k = 0 \quad (2)$$

has one and the same number  $r$  of roots  $\lambda_1(\sigma), \lambda_2(\sigma), \dots, \lambda_r(\sigma)$  with a  
Card 1/3

UDC: 517.946

L 20686-66

ACC NR: AP6012002

nonpositive real part;  $r$  is said to be the order or regularity of equation (1). G. V. DIKOPOLOV and G. Ye. SHILOV indicated a problem, correct in the half-space  $t > 0$ , which is defined by the initial conditions

$$\frac{\partial^s u(x, 0)}{\partial t^s} = u_s(x) \in H, \quad s = 0, 1, \dots, r-1, \quad (3)$$

where  $H$  is the space of all functions from  $L_2(X)$  and their generalized derivatives of any (finite) order, and  $r$  is the order of regularity of equation (1). The function  $G(x, t)$ , satisfying the conditions is said to be a fundamental solution to such a correct problem.

$$LG(x, t) = 0, \quad \frac{\partial^s G(x, 0)}{\partial t^s} = \begin{cases} 0, & s = 0, 1, \dots, r-2, \\ \delta(x), & s = r-1, \end{cases} \quad (4)$$

where  $\delta(x)$  is a  $\delta$ -function. Equation (1) is said to be homogeneous if  $(\sigma'_1, \dots, \sigma'_n)$  are homogeneous forms, of degree  $m - k$ , of  $\sigma'_1, \sigma'_2, \dots, \sigma'_n$  (e.g., the wave equation and Laplace's equation) and quadratically homogeneous if they are homogeneous forms, of degree  $2m - 2k$ , of the same variables (e.g., the heat-conduction equation and Schrodinger's equation).

G. Ye. SHILOV constructed the function  $G(x, t)$  for homogeneous equations (1) on the assumption that for equation (2) the roots  $\lambda_1(\sigma'), \lambda_2(\sigma'), \dots, \lambda_r(\sigma')$  are all distinct. As a supplement to SHILOV's method it is possible to construct  $G(x, t)$  for

Card 2/3

L 20686-66  
ACC NR: AP6012002

homogeneous and quadratically homogeneous equations (1) without any limitations on the multiplicity of roots  $\lambda_1(0), \dots, \lambda_r(0)$  of equation (2), and it is to this question that the present article is mainly devoted. The author states that he limits himself to the case of two independent variables  $x$  and  $t$ , since multi-dimensional problems reduce to two-dimensional problems by the decomposition of the  $\phi$ -function into plane waves. Section 2 of the article presents formulas expressing solution to problem (4) for homogeneous equations (1); these formulas are used to prove four theorems relating to the properties of the solutions to problem (1). Section 3 presents such formulas for quadratically homogeneous equations (1). The author thanks G. Ya. Shilov for bringing up questions and for valuable advice. Orig. art. has: 42 formulas. [JPRS]

AUTHORS: Zaguskin, V. L.; Kondrashov, V. Ye. 44, 55 46B

TITLE: Calculation of heat conduction and gas dynamics equations by passing along isolated regions

SOURCE: AN SSSR. Doklady, v. 163, no. 5, 1965, 1107-1109

TOPIC TAGS: heat conduction, gas dynamics, difference equation, boundary condition, stability criterion

ABSTRACT: The solutions of the heat conduction and gas dynamics equations using difference equations are discussed. The heat conduction equation is given by

$$\frac{\partial u}{\partial t} = a \frac{\partial^2 u}{\partial x^2}; \quad a = \begin{cases} a_1, & \text{if } x < 0, \\ a_2, & \text{if } x > 0 \end{cases}$$

subject to boundary conditions

$$\begin{aligned} a_1 u + \beta_1 \partial u / \partial x &= 0 \quad (x = -l_1); \quad a_2 u + \beta_2 \partial u / \partial x = 0 \quad (x = l_2); \\ u_{-0} &= u_{+0}; \quad a_1 \partial u / \partial x|_{x=-0} = a_2 \partial u / \partial x|_{x=l_0}. \end{aligned}$$

These equations are written in difference form and the following two necessary conditions are derived for stability of the solution

$$a_1/h_1 > a_2/h_2 \quad (c \rightarrow 0)$$

Card 1/2

L 00383-66  
ACCESSION NR: AP5021269

$$a_1 \geq a_2 \quad (c \rightarrow \infty).$$

The gas dynamics equations are expressed by

$$\frac{\partial u}{\partial t} + v_0 \frac{\partial u}{\partial x} = 0,$$

$$\frac{\partial v}{\partial t} - v_0 \frac{\partial u}{\partial x} = 0, \quad p = Av^{-\gamma}.$$

The corresponding necessary conditions for stability are given by

$$\frac{v_1 - h_1}{v_{s1} - \gamma_1} < \frac{v_2 - h_2}{v_{s2} - \gamma_2} \quad \left( s \frac{\tau}{h} \rightarrow 0 \right);$$

$$\frac{s_1}{\gamma_1} < \frac{s_2}{\gamma_2}, \quad s = \sqrt{\gamma p v} \quad \left( s \frac{\tau}{h} \rightarrow \infty \right).$$

This second condition becomes almost a sufficient condition if  $s(\tau/h) \ll 1$ . Orig.  
art. has: 15 equations.

AUTHOR: Kondrashov, V.Ye.; Shefov, A.S.

title: A method for determining the optical constants and thickness of semitransparent layers. Optical constants of a multi-alkali photocathode. Report, Tenth Conference on Cathode Electronics held in Kiev, 11-18 Nov 1963

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v.28, no.9, 1964, 1444-1449

TOPIC TAGS: absorption coefficient, refractive index, thin film, photocathode, absorption band

ABSTRACT: A method is described for measuring the thickness and optical constants (refractive index and absorption coefficient) of an absorbing layer on a transparent support. The measurements are to be performed by the three-intensity method of D. Male (Ann. Physik 12<sup>e</sup> Ser. 9, 10, 1954) at wavelengths for which the absorption is sufficient to enable the method to give accurate results, and by the two-intensity method of H. Murrmann (Z. Phys. 80, 161, 1932) at other wavelengths. The thickness of the film obtained from the three-index measurements is to be used in the reduction of the two-index measurements. The tedious graphical computations required to extract

1/3

L 12920-65  
ACCESSION NR: AP4045297

2

the optical constants and thickness from the measured reflection and transmission coefficients are described in detail. The thickness and optical constants of a series of sensitive multi-alkali photocathodes containing Sb, K, Na and Cs were measured by the proposed method. The photocathodes ranged in thickness from 232 to 360 Å and the measurements were extended over the wavelength range from 4000 to 8500 Å. The results obtained from the two- and the three-intensity methods at the shorter wavelengths are compared and found to be in good agreement. The reflection coefficient of a 232 Å layer on an aluminum surface was calculated over the full wavelength range from the measured optical constants of a similar layer on glass and the known optical constants of aluminum. Excellent agreement was obtained. Concerning the multi-alkali photocathodes, it is concluded that they are most sensitive when they are from 300 to 350 Å thick, that they have a single absorption band in the region of greatest sensitivity, and that the absorption coefficient is independent of thickness. Concerning the proposed measurement procedure, it is concluded that it is applicable provided there is an accessible region of wavelengths in which the absorption coefficient is greater than 0.5. "In conclusion, we take the occasion to express our deep gratitude to A.Ye.Melamid, Candidate in Technical Sciences, for a number of valuable suggestions during the course of the work, and to Ye.V.Fursova for assistance in calculating the theoretical curves." TITLE: Generalizing the relationship between stress, deformation and temperature during plastic flow of metals

SOURCE: Samoletostroyeniye i tekhnika vozduzhnogo flota, no. 4, 1965, 132-137

TOPIC TAGS: plastic flow, temperature characteristic, metal deformation

ABSTRACT: The author uses generalized three-dimensional diagrams in stress-deformation-temperature coordinates for various types of steel at a given deformation rate to determine the exponent  $m$  in the power function  $\sigma_i = Ae_i^m$ , where the coefficients  $A$  and  $m$  depend on temperature, material and deformation rate. Graphs for  $m$  as a function of temperature are plotted and analyzed to give the approximate linear relationship  $m = a + bT$ , where  $a$  and  $b$  are defined for each individual material and degree of deformation. The value of  $m$  may then be used to find the coefficient  $A$  as a function of temperature. Analysis of graphs for this function give the approximate linear relationship  $A = k + lT_i$ , where  $k$  and  $l$  depend on the given material. Substitution of the formulas for  $m$  and  $A$  in the original formula gives  $\sigma_i = (k + lT_i)e_i^{a+bT_i}$ , which may be used for determining the most economic conditions for material deformation. TOPIC TAGS: die yield stress, plastic flow

ABSTRACT: The author describes metal flow along the broaching edge of a die in a toroidal coordinate system. An expression is given for the rigidity factor with a given field of velocities. Since the law for the change in temperature along the broaching edge of the die is analogous to the law for the change in yield stress, graphs are given for the change in the rigidity factor at the edge of the die for various types of changes in yield stress: linearly increasing, linearly decreasing and parabolic with extrema at the beginning, at the end and in the center. It is shown that the most favorable conditions from the standpoint of pressability are linearly decreasing and parabolic with the maximum point at the beginning where the yield stress decreases with a reduction in radius. Orig. art. has: 4 figures, 2 tables, 8 formulas.

		<p>Changes in vitamin content in the canning of vegetables.  V. S. Grishkev and A. A. Kondrashova. <i>Konser. i Pidoboroch.</i> Prog. 11, № 2/3, 24-9 (1940); <i>Clesm. Znat.</i> 1941, II, 2255-6; cf. C. A. 36, 52061.—Spinach contg. 0.1-29 mg. % vitamin C loses 00-62% by blanching. Losses (based on original values) are, resp., 75-77, 81, 87-93 and 95% for 0, 1, 4 and 10 months' storage. Carotene remains unchanged. Thiamine (3.51 γ/g.) and riboflavin (4.4 γ/g.) losses in blanching are, resp., 17 and 25%, and there is no further loss during the first 4 months' storage. Green peas (40.8-64.08 mg. %) lose 30% vitamin C in blanching, 25-35% by sterilization, and 21% after 3.5 months' storage. The carotene content (0.29-0.63 mg. %) remains practically unchanged. Thiamine (4.08-7.38 γ/g.) and riboflavin (3.18-4.8 γ/g.) decrease 0 and 9-25%, resp., in blanching, 60 and 28%, resp., by sterilization, and 0 and 25%, resp., during storage for 3.5 months. Tomatoes (30.10-32.53 mg. %) lose very little ascorbic acid in the combined processes of slicing, heating and extra, but heating, sterilization and storage for 1 month cause a decrease of 50-65%. Losses by storage for 4 and 6 months in glass containers are 47 and 68%, resp.; in metal, 10 and 30%. Carotene losses take place only in the seeds of seeds and seeds. Riboflavin (0.2292-0.2988 γ/g.) remained practically unchanged by sterilization but 14% of the thiamine (0.7908-0.9141 γ/g.) was lost.</p> <p style="text-align: right;">W. J. The biochemical characteristic of the parabiotic process. M. N. Kondrashova [Lab. of pharmacology of metabolism, Inst. Pharmacol., Rxptl. Chemotherapy, and Chemo-prophylaxis, Acad. Med. Sci. U.S.S.R., Moscow]. *Byull. Eksp. Biol. Med.* 37, No. 1, 40-4(1034).—By subjecting soleus and gastrocnemius muscles of anesthetized animals to stimuli of various intensities it was possible to study the biochem. changes taking place at various degrees of muscular responses. Since the changes involve mainly P, its various fractions were detd. quantitatively: total inorg. (A), total org. (B), adenosinetriphosphoric acid (C), adenosine-diphosphoric acid (D), and phosphocreatine (E). D and E were detd. according to Alekseeva (*C.A.* 45, 7174i) and the myosin method was used for detg. C. During the first phase which was characterized by increased intensity of stimuli and corresponding increased responses B increased and A decreased. The reverse took place during the second phase with decreasing intensity of stimuli. Most characteristic is the B/A ratio. It is above normal during the first phase (nearly 50%) and below during the 2nd (34-84%). The increase of B is due mainly to increased E and to a much smaller degree to C while D practically disappears. The reverse took place during the change to 2nd phase: a sharp decrease of E, a considerable one of C and increase of D almost up to normal. A. Mirkin

KONDRAKHOVA, A. A.

U.S.S.R.

The enzymatic destruction of vitamin B<sub>1</sub>. V. N. Butin and A. A. Kondrashova. *Trudy Fiziol. Nauch.-Issledov. Vitamin.* 14(7), 122-7 (1953).—A study was made of the destruction of vitamin B<sub>1</sub> in zola, and in heat-dried rye and wheat bread. Cryst. vitamin B<sub>1</sub> was dissolved in H<sub>2</sub>O to concn. 542 mg./100 ml. To 5 g. of glucose 1 ml. of the vitamin soln. was added, heated for 6 min. to 150-170°, rapidly cooled, 100 ml. H<sub>2</sub>O added, and vitamin detd. fluorometrically. It was almost completely destroyed. It is suggested that thiamine in the presence of monosaccharides is destroyed in baked products. Slices of rye bread 2-2.5 cm. thick enriched with vitamin B<sub>1</sub> to contain 10.18%/g. of dry substance were heated at 140-150° for 6 hrs. and residual vitamin B<sub>1</sub> was detd. In 3 samples it was 31, 29, and 32% of the original. In practice in the U.S.S.R. the temp. of drying bread for Zwietback was frequently 880-800°. It is assumed that under such conditions and in the presence of sugars, the vitamin B<sub>1</sub> in com. dried bread is completely destroyed. With wheat bread the loss is lower.

B. S. Levine

Vitamins B<sub>1</sub>, B<sub>2</sub>, and PP in grain and products of its treatment. K. L. Povolotskaya, A. A. Kondrasheva, O. I. Pushkina, and E. P. Skorobogatova [A. N. Bakh Inst. Biochem., Acad. Sci. U.S.S.R., Moscow]. Biokhim. Zerna, Akad. Nauk S.S.R., Sbornik 2, 179-92 (1954).—Vitamin determinations were made on specimens of grain from wheat, rye, barley, corn, buckwheat, peas, soybeans, sunflower, linseed, and cotton. The highest content of thiamine is in sunflower seed (2.1 mg./kg.), of riboflavin in soybean (3.16), and nicotinic acid in sunflower (58.6), and wheat (81-60), as well as barley (87). The loss of the B vitamins in treatment of the grain varies with the techniques employed; the removal of the seed covers during milling affects the vitamin content of the flour but little. G. M. K.

Number of carbonyl groups in acetylcellulose and their effect on  
mechanical properties.

It is difficult to measure the mechanical properties of cellulose gels with different numbers of carbonyl groups. It is known that NaOH, NaClO<sub>2</sub>, NaNO<sub>2</sub>, Na<sub>2</sub>CO<sub>3</sub>, Na<sub>2</sub>SO<sub>4</sub>, Na<sub>3</sub>PO<sub>4</sub> and Na<sub>2</sub>HPO<sub>4</sub> do not affect the mechanical properties of cellulose gels with different numbers of carbonyl groups. The nature of cellulose gels with different numbers of carbonyl groups does not show any effect on the strength of cellulose gels. A gel with increased viscosity has a higher strength.

TITLE: Magnetic flaw detector. Class 42, No. 180391

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 7, 1966, 73

TOPIC TAGS: flaw detection, magnetic amplifier, magnetic method

ABSTRACT: This Author Certificate presents a magnetic flaw detector containing a power transformer, electromagnets, a capacitor, and rectifiers through which pulsed discharge of the capacitor is produced, and an automatic circuit controlling the rectifier triggering. Longitudinal magnetization in the automatic circuit is produced by electromagnets, and circular magnetization--by the gating of the pulsed current. To check parts of any size or form with subsequent total demagnetization, the controlled rectifiers are in the form of opposing controlled semiconductor diodes and are connected in the transformer primary and secondary circuits. The control electrodes of the primary diodes are connected to the

capacitor discharge circuit. The control electrodes of the secondary diodes are connected to the automatic circuit. To establish the required strength of the magnetization current and the reversing frequency of the demagnetization current, the automatic circuit contains magnetic amplifiers whose outputs are connected to the control electrodes of the transformer secondary, and the input windings--with a potentiometer.

TITLE: Improving the quality of viscose cord

SOURCE: Khimicheskiye volokna, no. 3, 1966, 42-43

TOPIC TAGS: cellulose, synthetic material, cellulose plastic, synthetic fiber

ABSTRACT: The details of a modified procedure for manufacturing high tensile strength viscose cords are described. In essence, the procedure consists of accelerated processes of coagulation, filtration, and cord forming. It also requires the use of high purity reagents: sulfuric acid (GOST 2184-59), and ethylene oxide- and aliphatic amine derivatives as modifiers. The modified procedure does not require any new machines, only a minor adjustment of the cord spinning procedure. It is claimed that the modified procedure is capable of yielding viscose cords with tensile strength by 50-60% greater than that manufactured elsewhere in the world. Orig. art. has: 2 figures.

Title : Tomato Infection by Macrosporium and Phytofluorine in Southern Sakhalin Environments.

Orig Pub : Soobshch. Sakhalinsk. fil. AN SSSR, 1955, No 2, 16-21

Abstract : Tests were conducted for a 3 year period on varieties of tomatoes in the Sakhalin Affiliate, Academy of Sciences USSR as to resistance against macrosporiosis and phytoflurosis. Of the varieties studied (~ 60) there were none totally resistant to these diseases. Cultivation of seedlings in nutrient cubicles composed of 6 parts of lowland turf, 2 parts of sawdust and 1 part of mullein and the addition of mineral fertilizers (N-0.1 g, P<sub>2</sub>O<sub>5</sub> - 0.9 g, K<sub>2</sub>O - 0.3 g of active substance to each plant) increased the yield and decreased the number of diseased fruits.

Abstract: Planting boxes were used to raise the sprouts of early cabbage at the experimental field of the Sakhalin affiliate of the Academy of Sciences USSR in 1950-1952; this increased the cabbage yield by 1-1/2-2 times and speeded up ripening by 13-17 days. A record cabbage crop for Sakhalin was gotten at the Petropavlovsk sovkhoz in Anivskiy Rayon, totaling 1036 centners per ha. The recipes for setting up the planting boxes are presented. -- G. N. Enzymic properties of necrosin (macrocystase) of inflammatory exudates. V. Z. Gorkin and M. N. Kondrashova (Inst. Biol. and Med. Chem., Acad. Med. Sci. U.S.S.R., Moscow). Biokhimiya 18, 288-95 (1953).--Necrosin (I) was obtained from exudates of experimentally produced inflammatory processes in the pleural cavity and subdermal tissues of the dog by injection of turpentine, as well as from purulent exudates obtained from hospitalized cases. After preliminary partial removal of nucleoproteins, the exudates were fractionated by  $(NH_4)_2SO_4$ . The protein fractions thus obtained were freed from sulfate by dialysis, dried, and stored in the cold. They were suspended in 0.9% NaCl and injected intradermally into mice. In the presence of I dermonecrosis appeared at the point of injection. Studies of the proteolytic properties of the purified and unpurified substances were carried out. A soln. of the protein substrate (usually denatured  $\beta$ - +  $\gamma$ -globulins of blood serum) in 0.9% NaCl, buffer, I, and toluene were incubated at 37°. Fixation was by means of trichloroacetic or acetic acid. Amino N was detd. with the Van Slyke app., residual N by micro-Kjeldahl, and unchanged protein by the biuret color reaction. Results were recorded after 24 and 48 hrs. The authors conclude that I of inflammatory exudates is a proteolytic enzyme of the type of trypsin, having an optimum pH 7.7-8.2. It splits a variety of proteins and possesses fibrinolytic properties. In the initial stages of I activity (as well as of crystalline trypsin) on the proteins there appears the process of peptidization with a concomitant high increase in amino N, which starts after a prolonged period of incubation. Metallic cations which impede the proteolytic activity of trypsin have a similar impeding effect upon the protein-splitting power of I. No such effect is observed in the process of protein peptidization by I or by crystalline trypsin. The ability of I to cause dermonecrosis is dependent upon its proteolytic properties. B. S. L.

Kondrashova, S. M.S/183/59/000/06/006/027  
B004/B007TITLE: New Fibers on the Basis of Co-polyesters

PERIODICAL: Khimicheskiy vekloka, 1959, Nr 6, pp 21-24 (USSR)

ABSTRACT: The authors mention the disadvantages of the polystyrene-terephthalate fiber Laysan: bad colorability, stiffness of the fiber produced herefrom. According to Western publications (Refs 2, 3) co-polyesters made from dimethyl-terephthalate (DMT), ethylene glycol and small additions of glycols, di-carboxyl acids or oxyacids do not have these disadvantages. The authors investigated co-polyesters of DMT with p-oxy-ethoxy benzoic acid (OAB). The synthesis of the methyl ester of this acid from p-oxybenzoic acid (Ref 4) worked out by M. N. Bogdanov in cooperation with A. A. Strepikheyev (Deceased) is briefly described. It was carried out in the presence of 0.1% LiOH + Al<sub>2</sub>O<sub>3</sub>, in the following stages: Reaction of DMT and the methyl ester of OAB with ethylene glycol at 160 to 190°, dis-

Card 1/3

tilling of the excess ethylene glycol at 200 ~ 250°, poly-condensation at 260-275°. Figure 1 shows the influence exerted by the additions of OEB to DMT upon the melting point of the co-polymer. The most favorable effect was produced by additions of up to 10%. The authors investigated such co-polymers with 5 and 10% OEB which they denote as oxon-5 and oxon-10. Synthesis was carried out in the presence of 0.02% zinc acetate. Figure 2 shows that the reaction with ethylene glycol is quicker in the case of oxon-5 and oxon-10 than in that of pure DMT. Table 1 shows the melting temperature and the specific viscosity of the solution of oxon-5 and oxon-10. Both co-polymers were thermographically investigated according to V. O. Gorba-cheva and N. V. Mikhaylov (Ref 6) (Table 2) and showed a lower vitrification temperature than Laysan, but they are less refractory. The fibers produced from oxon-5 and oxon-10 were investigated with respect to the breaking length (32-35 km), breaking elongation (30-41.5%), bending strength (Fig 3) and elastic deformation (Fig 4). The rayon fibers had a softer feel than Laysan but higher shrinkage (15 to 23%). An inves-

TITLE: A machine for fatigue testing parts or material specimens. Class 42, No. 183456 [announced by the Central Scientific Research Institute of Technology and Machine Building (Tsentral'nyy nauchno-issledovatel'skiy institut tekhnologii i mashinostroyeniya)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 13, 1966, 98

TOPIC TAGS: rotor blade, fatigue test, bend test, tensile test

ABSTRACT: This Author's Certificate introduces a machine for fatigue testing parts or material specimens under the simultaneous effect of bending and tension at high temperatures in special media. Blades to be tested are mounted on a rotating disc located in a test chamber and subjected to oscillatory motion generated by an exciter. The unit is designed to produce axial flexural oscillations of the disc, and also for excitation over a broad frequency range from a few dozen to several thousand cycles per second. Design of the machine is simplified by using an electrodynamic exciter made with a short-circuited rotating coil, a stationary pickup (e. g. a ca-

TITLE: The Induced Velocities of Vortex Lines of Arbitrary Form  
(Induktivnyye skorosti vikhrevykh shnurov lyuboy formy)

PERIODICAL: Tr. Leningr. in-ta aviats. priborostroyeniya, 1953, Nr 4,  
pp 3-15

ABSTRACT: The paper covers the determination of the velocity produced  
by a curved vortex filament of arbitrary form and of variable intensity  
at any point of the filament. In order to solve the problem, a method  
by A.A. Dorodnitsyn (Prikl. matem. i mekhanika, 1944, Vol 8,  
Nr 1, pp 33-63) is used. The solution is attained with the use of  
the Biot-Savard formula for a point situated at a small distance  
 $\xi$  from the axis of the filament, and by eliminating the singularity  
obtaining for  $\xi \rightarrow 0$ .

TITLE: Induced Velocities of Attached Vortices of an Air Screw with Non-radial Blades (Induktivnyye skorosti prisoyedinenykh vikhrey vinta s neradial'nymi lopastyami)

PERIODICAL: Tr. Leningr. in-ta aviats. priborostr., 1956, Nr 13, pp 3-20

ABSTRACT: The paper describes a calculation of the velocity induced by a curvilinear lifting vortex replacing the non-radial blade of an air screw. The formulas obtained are useless for practical calculations, since the velocity on the lifting vortex becomes infinity. The introduction of a finite vortex thickness does not help, because the radius of the vortex core remains unknown. From wing theory it is known that in these cases the scheme of the lifting vortex can be used only with limited transition from the lifting vortex surface to the lifting vortex (see Dorodnitsin, A. A, Prikl. matem. i mehanika, 1944, Vol 8, Nr 1).

TITLE: Approximate Calculation Method for the Induced Velocities of the Free Vortices of a Propeller With Nonradial Blades (Priblizhennyi metod vychisleniya induktivnykh skorostey svobodnykh vikhrey vinta s neradial'nyimi lopastyami)

PERIODICAL: Tr. Leningr. in-ta aviats. priborostr., 1956, Nr 13, pp 21-40

ABSTRACT: In the case of nonradial blades, the axes of which are located on helicoidal surfaces (the author designates such propellers as "rational"), the computation of the velocities induced by the free vortices is reduced to the evaluation of the supplementary velocities due to those regions of the propeller vortices that are located between the blade axis and a certain mean radial straight line. In order to compute the supplementary velocity the author employs the expansions previously applied by N. N. Polyakov and, additionally, an expansion of  $\sin \vartheta$  and  $\cos \vartheta$  according to powers of  $\vartheta$ . Having concluded that the basic part of the induced velocity consists of the first terms of the expansions, which represent the velocity due to a propeller

PERIODICAL: Tr. Leningr. in-t aviats. priborostr., 1956, Nr 14, pp 46-62

ABSTRACT: Using the results of previous works (Tr. Leningr. in-ta aviats. priborostr., 1954, Nr 10, 1956, Nr 13) the Author derives an integral-differential equation for determining the circulation. The calculations that are carried out show that the effect of the non-radial position of the blades on the induced velocity may be disregarded in the calculation of the circulation.
